-----

Since microprocessors were first introduced they have almost completely overtaken all other central processing unit implementation methods. The first commercially available microprocessor, made in ...

IBM chose Intel's 8088 processor for the brains of the first PC. This choice by IBM is what made Intel the de facto leader of the CPU market. It remains the leader of microprocessor ...

Learn about the important events and milestones in the history of computer processors, from the first transistor to the latest CPUs. See the release dates and features of popula...

Unlike conventional processors, clockless processors have no central clock to coordinate the progress of data through the pipeline. Instead, stages of the CPU are coordinated using logic devices called ...

Discover the journey of CPUs, from the UNIVAC 1103 to modern microelectronic marvels, serving as the central processing unit in computers and electronic devices, revolutionizing ...

The central processing unit (CPU), sometimes referred to as the brain of a computer, is a crucial component that enables computers to perform essential computational tasks.

CPUs function by using a type of repeated command cycle that is administered by the control unit in association with the computer clock, which provides synchronization assistance. The work a CPU ...

In this article, we'll take a deep dive into the fascinating history of CPUs, from their humble beginnings to their current state of the art. The Early Days: The Birth of the First CPUs. Believe it or not, the first ...

Intel introduced the 8008 processor on April 1, 1972. Motorola introduced its first processor in 1974, the MC6800, an 8-bit processor featuring a 1-2 MHz clock frequency. Intel's ...

# Central processing unit timeline

Over the years, CPU technology has undergone significant transformations, driven by advancements in semiconductor technology, architectural innovations, and the ever-increasing demand for higher ...

1950s: Early designs  
Timeline of events  
1960s: Computer revolution and CISC  
1970s: Microprocessor revolution  
Early 1980s-1990s: Lessons of RISC  
Mid-to-late 1980s: Exploiting instruction-level parallelism  
1990 to today: Looking forward  
External links  
The instruction scheduling logic that makes a superscalar processor is Boolean logic. In the early 1990s, a significant innovation was to realize that the coordination of a multi-ALU computer could be moved into the compiler, the software that translates a programmer's instructions into machine-level instructions. This type of computer is called a very long instruction word (VLIW) computer. Scheduling instructions statically in the compiler (versus scheduling dynamically in the processor) can ...
