Annual electricity generation from wind is measured in terawatt-hours (TWh) per year. This includes both onshore and offshore wind sources.

This dataset encompasses a wide range of information, including meteorological data, turbine specifications, power output records, and environmental factors. It provides a valuable ...

Also includes information on each country's actual yearly production of wind-generated electricity, as well as the amount of electricity generated in offshore wind farms as compared on onshore farms.

Wind supplies 57% of Denmark's electricity generation and over 20% in ten other countries. 7 Global wind additions reached a record 117 GW in 2023. 7 In 2024, onshore installations surpassed 100 GW ...

This data shows the relative US electricity generation by fuel type over the last 6 years. Wind energy production is about 12% of the US total and slowly increasing as of 2024.

Also includes information on each country's actual yearly production ...

Utility-scale wind energy is the largest source of renewable electricity generation in the U.S. Learn more wind energy facts and statistics.

Total annual U.S. electricity generation from wind energy increased from about 6 billion kilowatthours (kWh) in 2000 to about 434 billion kWh in 2022. In 2022, wind turbines were the source ...

Wind resources are calculated based on the average wind speed and the distribution of wind speed values occurring within a particular area. Areas are grouped into wind power classes that ...

These methods are based on non-linear and linear relationships between meteorological data (such as wind

What does wind power generation data include

speed, wind direction and temperature from observations and/or NWP models) and the ...

Wind power is the nation's largest source of renewable energy, with more than 150 gigawatts of wind energy installed across 42 U.S. States and Puerto Rico. These projects generate ...
