-----

However, the reactive power output from wind generation can be reduced if the VSC-HVDC system provides sufficient reactive power. The proposed method determines the optimal wind ...

This paper studies the feasibility of wind power replacing coal power generation. The carbon footprint of wind turbines in different countries and regions is different.

Efforts to maximize power generation from offshore wind energy have led to the development of more efficient and larger wind turbines. These larger turbines have greater rotor ...

This study developed a method to quantify the Annual Degradation Rate (ADR) caused by turbine aging and applied it to operational wind farms to estimate the power curve and the ...

By replacing fossil fuel-based power generation with wind energy, we not only reduce the overall carbon footprint but also ensure cleaner air quality for communities. Wind energy effectively displaces the ...

Over 2 Mt of wind turbine blades are expected to be retired in the U.S. by 2050. Customers can purchase renewable energy through unbundled renewable energy certificates (RECs), community ...

This work was authored by the National Renewable Energy Laboratory (NREL), operated by Alliance for Sustainable Energy, LLC, for the U.S. Department of Energy (DOE) under Contract No. DE-AC36 ...

Wind turbine major systems (blades, pitch, main bearing, gearbox, and generator) are integrated into a composite system. Specifications for these systems and components are developed to achieve ...

Forecast power generation is a 50% probability mean annual production forecast (P50 forecast), calculated by an independent, third-party technical consulting firm, that serves as the base forecast ...
